

Can your business afford downtime?

Have a network you can trust, and reduce risk with IP Fabric network assurance.

Managing risk is a fundamental part of modern financial services, but have you considered the risk your network may pose to your organisation? The network is the backbone to today's modern hybrid infrastructures and having clarity on complete network state and reducing risk of down time and losses is crucial.

In the complex world of financial services, having a technology partner you can trust to help manage your critical infrastructure is vital.

IP Fabric's Automated Network Assurance platform helps leading financial organisations deliver services to clients with a secure and responsive network at the heart of their global operations.

Support Velocity of Innovation

To meet exceeding customer demands new user experiences need to be developed and deployed at blazing pace, leaving little room for operations to consume additional resources which comprise the majority of the total cost of ownership. IP Fabric validates network behavior continuously ensuring integrity and stability of the infrastructure through closed loop integrations.

Tackle Security at Scale

The network infrastructure is more diverse and complex than ever and network and security teams require tools to continuously validate security policy at scale for the whole infrastructure end to end, including private and public cloud, to eliminate potential firewall bypasses or unexpected exit paths.

Breaking Down Silos and Mitigating Risks

Observability across internal silos is critical to the success of the technical teams as collaboration cannot be effective without sharing of detailed insights. IP Fabric represents the complete network infrastructure as a single database, including every technical detail necessary for effective collaboration.

Risk & Compliance

Risk and compliance are key to financial services. IP Fabric helps Financial Services organisations manage the risk posed by network inaccuracies, whilst supporting their compliance efforts with regulations such as PCI-DSS. With automated network discovery, accurate network data is the baseline for regulatory compliance.

Cloud Adoption

Cloud services are a vital part of most Financial Services Infrastructures. IP Fabric is able to model the networking within your AWS Virtual Private Clouds, giving IP Fabric read-only AWS API credentials and in return IP Fabric will inventory your VPCs, transit gateways, subnets, routing tables and NAT gateways and build a networking topology diagram for your Amazon Cloud instances.

Adoption of Automation

According to the Network to Code NetDevOps Survey (2019) between 38-52% of respondents are investing time and resources to deliver operational functions around data collection, compliance verification and pre- & post-change validation. These tasks are the burden of network engineers globally and by automating them network managers can free up key engineer resources to focus on higher value projects.

SD-WAN

Being able to see the SD-WAN as part of the bigger network picture is a key part of the IP Fabric platform. With the release of 3.8.0, IP Fabric has added support for Versa's SD-WAN product to our existing Cisco Meraki support. This allows you to connect your IP Fabric instance to the Versa Director to retrieve inventory and topology information and connect it to your traditional network infrastructure.

Precise Inventory

It is estimated that approximately 75% of downtime is caused not so much by a failure of technology, but rather by how that technology is configured, administered, and utilized. The technical debt of legacy IT and the need to upgrade to manage the increase in digital banking services is a challenge for Financial Services organisations. IP Fabric provides a fast and secure tool for documenting enterprise infrastructure across legacy and hybrid networks.
