

IP FABRIC

IP Fabric | Managed Services License Program

IP Fabric's Automated Network Assurance Platform revolutionizes how organizations manage increasingly complex networks by providing deep insight into network behavior.

At IP Fabric, we recognize the value of our technology as a tool for you to enhance how you deliver managed services to your customers, which is why we're pleased to introduce our MSP License Program.

Challenge

One of the greatest challenges for any IT organization is understanding their network topology and behavior. Most still rely on manual documentation and diagrams from when the network was first built. Unsurprisingly, this can cause serious issues for a Managed Service Provider when they take over management of the customer environment and impact the ability to troubleshoot problems and generate accurate reports throughout the life of the contract.

Managing a poorly documented network is very time- and labor-intensive, often involving skilled resources spending days identifying and documenting devices, configurations and topology rather than carrying tasks that bring value to the wider business.

Solution

Incorporating IP Fabric's Automated Network Assurance into your Managed Service platform allows you to take an accurate snapshot of your customer's complete network (LAN, WAN, Datacentre and Cloud), providing in-depth details of every device, configuration, and relationship at layer 1, layer 2 and layer 3 - reducing a process that once took days to a matter of minutes. You can now accurately map your customer's network and track the effect of changes over time quickly and easily. IP Fabric also plays a vital role in troubleshooting network and connectivity issues. Our discovery and documentation capability transforms how new Managed Service customers are assessed and onboarded, saving time and ensuring completeness and accuracy of the data used in visibility tooling and admin processes.

IP Fabric's Managed Service Licensing is calculated using the total number of concurrent network devices, with no limit to the number of customers, deployments, and users who will have access to the network data.

Benefits

The Managed Service License Program provides you a virtual pool of licenses on a one-, two- or three-year term which can be assigned to an unlimited number of Managed Service customers. This allows you to utilize IP Fabric to streamline your onboarding discovery, delivery, and troubleshooting processes as well as delivering additional value-add services to your customers.

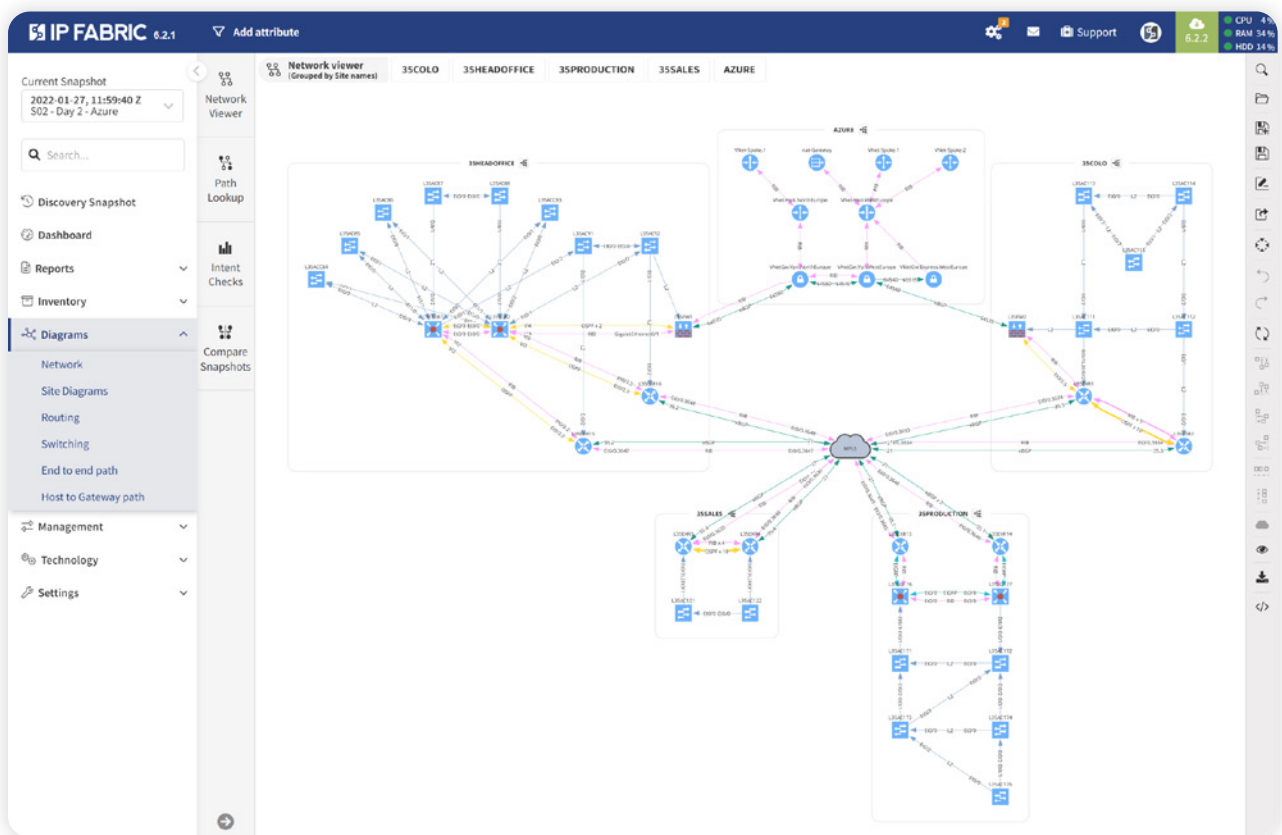

- Inventory Accuracy
- Lifecycle Management
- Compliance Audits
- Change Validation & Tracking
- End-to-End Path Validation
- Security Reporting

An Integrated Ecosystem

Deployment

IP Fabric has been built from the ground up as an “API First” platform. This simplifies integration with existing monitoring and management tools, ITSM systems, and CMDBs, and as a result, Managed Service providers can enhance their existing management solution ecosystem quickly and seamlessly. IP Fabric also provides a Python SDK and Ansible collection for development of custom capabilities and to integrate with automation workflows to help create self-service processes.

In addition, the depth and breadth of network data exposed by IP Fabric opens the door to a wide range of additional service offerings across the LAN, WAN, Datacentre and Cloud – enhancing project implementation and delivery, security projects and compliance audits for example.

Get In Touch

About IP Fabric

IP Fabric is a vendor-neutral network assurance platform that automates the holistic discovery, verification, visualization, and documentation of large-scale enterprise networks, reducing the associated costs and required resources whilst improving security and efficiency.

It supports your engineering and operations teams, underpinning migration and transformation projects. IP Fabric will revolutionize how you approach network visibility and assurance, security assurance, automation, multi-cloud networking, and trouble resolution.

Don't take our word for it

See how assurance can transform your approach to network management.
